Many Americans Believe Fake News Is Sowing Confusion

23% say they have shared a made-up news story – either knowingly or not

In the wake of the 2016 election, everyone from President Obama to Pope Francis has raised concerns about fake news and the potential impact on both political life and innocent individuals. Some fake news have been widely shared, and so-called “pizzagate” stories led a North Carolina man to bring a gun into a popular Washington, D.C. pizza restaurant under the impression that it was hiding a child prostitution ring.

According to a new survey by Pew Research Center, most Americans suspect that made-up news is having an impact. About two-in-three U.S. adults (64%) say fabricated news stories cause a great deal of confusion about the basic facts of current issues and events. This sense is shared widely across incomes, education levels, partisan affiliations and most other demographic characteristics. These results come from a survey of 1,002 U.S. adults conducted from Dec. 1 to 4, 2016.¹

Though they sense these stories are spreading confusion, Americans express a fair amount of confidence in their own ability to detect fake news, with about four-in-ten (39%) feeling very confident that they can recognize news that is fabricated and another 45% feeling somewhat confident. Overall, about a third (32%) of Americans say they often see political news stories online that are made up. While it is difficult to measure the precise extent to which people actually see news that has been completely fabricated – given that news consumers could see but not recognize made-up news stories as well as mistake factual stories for false ones — these figures provide a high-level sense of the public’s perception of this kind of content.

¹ The “pizzagate” incident occurred during the final day of the field period, but does not appear to have had any effect on the results: The responses of people contacted on this day do not differ significantly from the responses of people contacted before the incident.
And some Americans say they themselves have shared fake news. Overall, 23% say they have ever shared a made-up news story, with 14% saying they shared a story they knew was fake at the time and 16% having shared a story they later realized was fake.

When it comes to how to prevent the spread of fake news, many Americans expect social networking sites, politicians and the public itself to do their share. Fully 45% of U.S. adults say government, politicians and elected officials bear a great deal of responsibility for preventing made-up stories from gaining attention, on par with the 43% that say this of the public and the 42% who say this of social networking sites and search engines. Although the overall portion of Americans who place responsibility on each is about equal, individuals have different perspectives on how that responsibility should be distributed. Just 15% of Americans place a great deal of responsibility on all three of these groups, while a majority (58%) feels instead that one or two of them bear a great deal of responsibility.
While fake news became an issue during the highly charged 2016 presidential election campaign, Republicans and Democrats are about equally likely to say that these stories leave Americans deeply confused about current events. About six-in-ten Republicans say completely made-up news causes a great deal of confusion (57%), and about the same portion of Democrats say the same (64%). And although independents outpace Republicans (69% say fake news causes a great deal of confusion), they are on par with Democrats. This perception is also mostly consistent across education, race, gender and age, though there is some difference by income. While a majority of those who make less than $30,000 a year say fake news causes a great deal of confusion (58%), this is a lower proportion than among those who make between $30,000 and $75,000 (65%) and those who make $75,000 or more (73%).

Americans generally confident in their ability to identify fake news

Although Americans see fake news as causing a great deal of confusion in general, most are at least somewhat confident in their own ability to identify when a news story is almost completely made up. About four-in-ten (39%) are very confident, while another 45% are somewhat confident. Only 9% are not very confident, and 6% are not at all confident. (This is similar to Americans’ general faith in their ability to tell when information online is trustworthy.)

Again, there are no differences between partisans: 36% of Republicans, 41% of Democrats and 40% of independents say they are very confident in their ability to recognize news that is made up. There are also no consistent differences in who feels very confident in terms of age, gender, income or race.

Majority are confident in their ability to recognize fake news

% of U.S. adults who are ___ in their ability to recognize made-up news

PEW RESEARCH CENTER
About a third say they often see fake political news online

Nearly one-in-three U.S. adults (32%) say they often see fake political news online, while 39% sometimes see such stories and 26% hardly ever or never do. In a rare instance of demographic differences, whites are more likely than blacks and Hispanics to say they often see fake news, and those with annual incomes of at least $75,000 are more likely than those who make less than $75,000 to say so.

Americans show some discernment between almost completely made up political news stories and those that are partially inaccurate. About half (51%) of U.S. adults say they often see political news online that is at least somewhat inaccurate – a higher proportion than those who say they see news that is almost completely made up.

Frequent spotters of made-up online political news are more likely to believe fake news causes confusion – and are also more confident in their ability to identify it. Roughly eight-in-ten (82%) of those who say they often see fake news online think such completely made-up news causes a great deal of confusion, compared with 56% of those who see fake news less frequently. And 51% of those who often see fake news are very confident in their ability to identify fake news, compared with a third of those who see it less often.

To be sure, there are limits to what this self-reported information can capture, as it cannot determine whether these levels of confidence are truly warranted. There could, for example, be more fake news on the internet that goes unnoticed (despite high confidence in one’s ability to detect it) or some news that is erroneously thought to be made up. Further research could help tease out these different possibilities. What’s clear even now, however, is that Americans perceive fake political news stories to be a consistent threat online – but see themselves as fairly adept at detecting when a story is made-up.
Nearly a quarter of Americans say they have shared fake political news online

Some Americans say they have contributed directly to the distribution of fake news by sharing it themselves. About a quarter (23%) say they have ever shared such stories, while roughly equal portions say they have shared made-up news knowingly and unknowingly.

Fully 16% of U.S. adults say they have shared fake political news inadvertently, only discovering later that it was entirely made up. This is more prevalent among those who say they often see such fake political news stories (22%) than among those who say they see fake news less often (13%), though no consistent demographic differences emerge.

A similar percentage, 14%, say they have shared fake news they knew was made-up – whether because they want to spread misinformation, to “call out” the stories as fake, for the amusement value, or for some other reason.

Taking these two questions together, about a quarter (23%) of U.S. adults say they have ever shared a fake political news story online, whether knowingly or unknowingly, with 7% sharing both when they did and did not know a story was made-up, 9% sharing only when they did not know, and 7% sharing only when they did know.

About one in four report sharing fabricated news – whether aware at the time or not

| % of U.S. adults who say they ... |  
|-----------------------------------|---|
| Shared a political news story online they later found out was made up | 16% |
| Shared a political news story online they knew at the time was made up | 14% |
| Did either/both of these | 23% |

“Many Americans Believe Fake News Is Sowing Confusion”
PEW RESEARCH CENTER
Social media, politicians and the public all called upon to help prevent spread of made-up news

If the spread of fake news is a problem, who bears responsibility for addressing it? In the month since the presidential election, social networking sites and search engines have taken steps to address the issue. And there have been calls for the government and the public itself to take action as well.

Americans collectively assign a fairly high and roughly equal amount of responsibility to all three of these groups. Fully 45% say government, politicians and elected officials have a great deal of responsibility, roughly equal to the proportion who say a great deal of responsibility lies with members of the public (43%) and with social networking sites and search engines (42%).

While each of these three groups was seen as responsible by about an equal share of the public, it is not the case that every American thinks each bears a great deal of responsibility. In fact, only 15% of U.S. adults say this of all three groups, while 58% named one (31%) or two (27%) of the three groups.

Age is the only area where clear demographic differences emerge. Americans ages 50 and older are more likely to place a great deal of responsibility on the government (53%) than those ages 18 to 49 (38%). There are no demographic differences for how much responsibility the public or social networking sites and search engines owe.

There is also a partisan difference on how much responsibility the government has to prevent the spread of fake news. While about half of both Republicans (48%) and Democrats (49%) say the government has a great deal of responsibility, only about four-in-ten independents (38%) say so.
There are no partisan differences in terms of the responsibility assigned to the two other groups, however.

Those who say they often see made-up political news online are more likely to say each of the three groups has a great deal of responsibility. About half (53%) place a great deal of responsibility on politicians (compared with 41% who see fake political news online less often), on social networking sites and search engines (53% vs. 37%) and on the public (51% vs. 39%).

**Methodology**

The analysis in this report is based on a Pew Research Center survey conducted Dec. 1 through Dec. 4, 2016, among a national sample of 1,002 adults, 18 years of age or older, living in the continental United States. Fully 500 respondents were interviewed on landline telephones, and 502 were interviewed on cellphones, including 318 who had no landline telephones. The survey was conducted by interviewers at Princeton Data Source under the direction of Princeton Survey Research Associates International. A combination of landline and cellphone random-digit-dial samples were used; both samples were provided by Survey Sampling International. Interviews were conducted in English and Spanish. Respondents in the landline sample were selected by randomly asking for the youngest adult male or female who was at home. Interviews in the cellphone sample were conducted with the person who answered the phone, if that person was 18 years of age or older. For detailed information about our survey methodology, visit: [http://www.pewresearch.org/methodology/u-s-survey-research/](http://www.pewresearch.org/methodology/u-s-survey-research/)

The combined landline and cellphone sample are weighted using an iterative technique that matches gender, age, education, race, Hispanic origin and region to parameters from the U.S. Census Bureau's 2014 American Community Survey and population density to parameters from the decennial census. The sample also is weighted to match current patterns of telephone status (landline only, cellphone only, or both landline and cellphone) based on extrapolations from the 2015 National Health Interview Survey. The weighting procedure also accounts for the fact that respondents with both landlines and cellphones have a greater probability of being included in the combined sample and adjusts for household size among respondents with landline phones. The margins of error reported and statistical tests of significance are adjusted to account for the survey’s design effect, a measure of how much efficiency is lost from the weighting procedures.

The following table shows the unweighted sample sizes and the error attributable to sampling that would be expected at the 95% level of confidence for different groups in the survey:

Topline questionnaire

PEW RESEARCH CENTER
December 1-4, 2016 OMNIBUS
FINAL TOPLINE
N=1,002

ASK ALL:
PEW1. How often do you come across news stories about politics and government online that you think are not fully accurate – often, sometimes, hardly ever, or never?

Dec 1-4
2016
N=1,002
51 Often
27 Sometimes
8 Hardly ever [OR]
10 Never
3 No answer

ASK ALL:
PEW2. And how about political news stories online that you think are almost completely MADE UP? Do you come across those often, sometimes, hardly ever, or never?

Dec 1-4
2016
N=1,002
32 Often
39 Sometimes
14 Hardly ever [OR]
12 Never
3 No answer

ASK ALL:
PEW3. Have you ever shared a political news story online that you later found out was made up?

Dec 1-4
2016
N=1,002
16 Yes
83 No
1 No answer
ASK ALL:
PEW4. And have you ever shared a political news story online that you thought AT THE TIME was made up?

Dec 1-4
2016
N=1,002
14 Yes
85 No
1 No answer

ASK ALL:
PEW5. As you may have heard, there have recently been some instances of so called “fake news stories” circulating widely online. How much responsibility does each of the following have in trying to prevent made up stories from gaining attention? First, [INSERT ITEM, RANDOMIZE] Do they have a great deal of responsibility, a fair amount of responsibility, not much responsibility, or no responsibility at all? ... How about [NEXT ITEM]?

a) Members of the public

Dec 1-4
2016
N=1,002
43 A great deal
31 A fair amount
13 Not much [OR]
11 None at all
3 No answer

b) The government, politicians, and elected officials

Dec 1-4
2016
N=1,002
45 A great deal
25 A fair amount
15 Not much [OR]
12 None at all
4 No answer

c) Social networking sites like Facebook and Twitter, and search sites like Google

Dec 1-4
2016
N=1,002
42 A great deal
29 A fair amount
12 Not much [OR]
13 None at all
5 No answer
**ASK ALL:**
PEW6. How confident are you in your own ability to recognize news that is made up? Are you very confident, somewhat confident, not very confident, or not at all confident?
